Auto Ticket Classification using Flow Designer

PHASE 3 – PROJECT DESIGN

System Design

The proposed system follows a ticket creation → Flow Designer trigger → keyword evaluation → category/subcategory update → email notification process.

Process Flow

- Student/Teacher creates ticket.
- Ticket is stored in the Incident Workflow table.
- Flow Designer is triggered when a record is created and Category is empty.
- The flow checks the Short Description for predefined keywords.
- The matching Category and Subcategory are assigned automatically.
- A confirmation email is sent to the caller.
- The result is validated through testing.

Classification Logic

- WiFi / Network → Category: Network; Subcategory: Wi-Fi
- Projector → Category: Hardware; Subcategory: Projector
- Password / Login → Category: Access; Subcategory: Forgot Password
- Slow / Hanging → Category: Performance; Subcategory: Slow Computer

Data Design

Required fields include Number (Auto Number), Caller (Reference), Category (Choice), Subcategory (Choice), Short Description (String), Description (String), State (Choice), Assigned Group (Reference), and Assigned To (Reference).

Dependency Design

Subcategory is configured as a dependent choice field based on Category. Wi-Fi depends on Network, Projector on Hardware, Forgot Password on Access, and Slow Computer on Performance.
