Auto Ticket Classification using Flow Designer

PHASE 5 – PROJECT DEVELOPMENT

Development Overview

The solution is implemented in ServiceNow using backend configuration and Flow Designer without complex scripting or machine learning.

Update Set Configuration

Create a Local Update Set named Project Update Set, set Application to Global, set State to In progress, save it, and make it the current set.

Custom Table

Create a custom table with the label Incident WorkFlow. Disable module creation and enable Auto Number through the table controls.

Fields

- Number – Auto Number
- Caller – Reference: sys_user
- Category – Choice: Network, Hardware, Access, Performance
- Subcategory – Choice: Wi-Fi, Projector, Forgot Password, Slow Computer
- Short Description – String
- Description – String
- State – Choice: New, In progress, On hold, Resolved, Closed
- Assigned Group – Reference: sys_user_group
- Assigned to – Reference: sys_user

Dependency Configuration

Configure Subcategory as a dependent field on Category and map the four subcategories to their corresponding categories.

Flow Designer

Create a Flow named Auto Classify School IT Tickets. Trigger: Record Created. Table: Incident Workflow. Condition: Category is Empty.

Automation Branches

- Wi-Fi/Network condition → Update record → Category = Network; Subcategory = Wi-Fi.
- Projector/Hardware condition → Update record → Category = Hardware; Subcategory = Projector.
- Forgot password condition → Update record → Category = Access; Subcategory = Forgot Password.
- Slow Computer condition → Update record → Category = Performance; Subcategory = Slow computer.

Email Action

After classification, use Send Email. To: Caller → Email. Subject: Your Request for the issue has been submitted. Add the ticket confirmation message in the body.

Activation

Activate the flow after completing the actions and conditions.
